Outline

What is ruby?

Wikipedia says...

Ruby is a dynamic, reflective, general purpose object-oriented programming language that combines syntax inspired by Perl with Smalltalk-like features.

Variables/Arrays/Hashes

- Variables

```
pickaxe_book = "Programming Ruby"
cs_bible = "Art of Computer Programming"
js_book = "Javascript: The Good Parts"
```

- Arrays

```
available_books = [ pickaxe_book, cs_bible ]
```

- Hashes

```
library = {
  :available => available_books,
  :checked_out => [ js_book ]
}
```

Variables/Arrays/Hashes

- Variables

```
pickaxe_book = "Programming Ruby"
cs_bible = "Art of Computer Programming"
js_book = "Javascript: The Good Parts"
```

- Arrays

```
available_books = [ pickaxe_book, cs_bible ]
```

- Hashes

```
library = {
  :available => available_books,
  :checked_out => [ js_book ]
}
```

Variables/Arrays/Hashes

- Variables

```
pickaxe_book = "Programming Ruby"
cs_bible = "Art of Computer Programming"
js_book = "Javascript: The Good Parts"
```

- Arrays

```
available_books = [ pickaxe_book, cs_bible ]
```

- Hashes

```
library = {
  :available => available_books,
  :checked_out => [ js_book ]
}
```

Defining Methods

Making life easier

```
def available?(library, book_name)
  library[:available].include?(book_name)
end
```

- Method body is enclosed by `def` and `end`.
  Parameters are a list of variable names.
- Method name must be lower case letters and _.
  It may be suffixed by ?, = or !.
- Last line is returned by the method.

Defining Methods

Making life easier

```
def available?(library, book_name)
  library[:available].include?(book_name)
end
```

- Method body is enclosed by `def` and `end`.
  Parameters are a list of variable names.
- Method name must be lower case letters and _.
  It may be suffixed by ?, = or !.
- Last line is returned by the method.

Defining Methods

Making life easier

```
def available?(library, book_name)
  library[:available].include?(book_name)
end
```

- Method body is enclosed by `def` and `end`.
  Parameters are a list of variable names.
- Method name must be lower case letters and _.
  It may be suffixed by ?, = or !.
- Last line is returned by the method.

Defining Methods

Making life easier

```
def available?(library, book_name)
  library[:available].include?(book_name)
end
```

- Method body is enclosed by `def` and `end`.
  Parameters are a list of variable names.
- Method name must be lower case letters and _.
  It may be suffixed by ?, = or !.
- Last line is returned by the method.

Conditionals

if/else syntax

```
if available?(library, "Art of War")
  puts "Sun Tzu's Art of War is available."
else
  puts "Art of War is not available."
  puts "Try later..."
end
```

Can be inlined:

```
puts "yay" unless boo?
```

Loops

For/While loops:

```
file = File.open("checked_out_backup.txt")
while (book = file.gets)
  library[:checked_out] << book
end
```

```
str = ""
for i in 0..(library[:checked_out].size) do
  str += "#{library[:checked_out][i]} "
end
puts "Checked out books: #{str}"
```

Blocks/iterators

Same as for, but easier

```
str = ""
library[:checked_out].each do |book|
  str += "#{book} "
end
puts "Checked out books: #{str}
```

- Invoke method `each` on the checked out books array.
- Declare a block that takes one parameter as `book`.
- Specify the body of the block to append the `book` to the `str`.

Blocks/iterators

Same as for, but easier

```
str = ""
library[:checked_out].each do |book|
  str += "#{book} "
end
puts "Checked out books: #{str}
```

- Invoke method `each` on the checked out books array.
- Declare a block that takes one parameter as `book`.
- Specify the body of the block to append the `book` to the `str`.

Blocks/iterators

Same as for, but easier

```
str = ""
library[:checked_out].each do |book|
  str += "#{book} "
end
puts "Checked out books: #{str}
```

- Invoke method `each` on the checked out books array.
- Declare a block that takes one parameter as `book`.
- Specify the body of the block to append the `book` to the `str`.

Blocks/iterators

Same as for, but easier

```
str = ""
library[:checked_out].each do |book|
  str += "#{book} "
end
puts "Checked out books: #{str}
```

- Invoke method `each` on the checked out books array.
- Declare a block that takes one parameter as `book`.
- Specify the body of the block to append the `book` to the `str`.

Accumulator Style

Even easier

```
str = arr.inject("") do |acc, item|
  "#{acc} #{item}"
end
puts "Checked out books: #{str}"
```

- `inject`'s block takes accumulator and book parameters.
- Return of the block is passed in the next acc
- Last acc is returned by the `inject` which is assigned to `str`.

Accumulator Style

Even easier

```
str = arr.inject("") do |acc, item|
  "#{acc} #{item}"
end
puts "Checked out books: #{str}"
```

- `inject`'s block takes accumulator and book parameters.
- Return of the block is passed in the next acc
- Last acc is returned by the `inject` which is assigned to `str`.

Accumulator Style

Even easier

```
str = arr.inject("") do |acc, item|
  "#{acc} #{item}"
end
puts "Checked out books: #{str}"
```

- `inject`'s block takes accumulator and book parameters.
- Return of the block is passed in the next acc
- Last acc is returned by the `inject` which is assigned to `str`.

Accumulator Style

Even easier

```
str = arr.inject("") do |acc, item|
  "#{acc} #{item}"
end
puts "Checked out books: #{str}"
```

- `inject`'s block takes accumulator and book parameters.
- Return of the block is passed in the next acc
- Last acc is returned by the `inject` which is assigned to `str`.

Declaring a Method With Block

Sample implementation of `inject`

```
def available_inject(library, init, &block)
  raise "Block missing" unless block_given?
  arr = library[:checked_out]
  acc = init
  arr.each { |item| acc = yield(acc, item) }
  acc
end
```

Declaring a Method With Block

Sample implementation of `inject`

```
def available_inject(library, init, &block)
  raise "Block missing" unless block_given?
  arr = library[:checked_out]
  acc = init
  arr.each { |item| acc = yield(acc, item) }
  acc
end
```

- Block is passed using &
- `block_given?` returns whether method was provided a block.

Declaring a Method With Block

Sample implementation of `inject`

```
def available_inject(library, init, &block)
  raise "Block missing" unless block_given?
  arr = library[:checked_out]
  acc = init
  arr.each { |item| acc = yield(acc, item) }
  acc
end
```

- `yield` yields control to the provided block with specified parameters.

Declaring a class

Declaration syntax:

- Classes are declared by keyword `class`
- Instance variables are specified by prepending '`@`' to a variable name (e.g. `@foo`)
- Class variables are specified by prepending '`@@`' (e.g. `@@bar`)

Sample declaration

```
class Book
  @@library = Library.instance
  def name; @title end
  def name=(new_title)
    @title = new_title; @title
  end
  attr_accessor :author, :isbn
end
```

- Class names must be capitalized.
- Creates `:author` and `isbn` accessors.

Sample declaration

```
class Book
  @@library = Library.instance
  def name; @title end
  def name=(new_title)
    @title = new_title; @title
  end
  attr_accessor :author, :isbn
end
```

- Class names must be capitalized.
- Creates `:author` and `isbn` accessors.

Sample declaration

```
class Book
  @@library = Library.instance
  def name; @title end
  def name=(new_title)
    @title = new_title; @title
  end
  attr_accessor :author, :isbn
end
```

- Class names must be capitalized.
- Creates `:author` and `isbn` accessors.

Inheritance

Example (Inheriting classes)

```
class Game < Book
  attr_accessor :platform
end
```

- `Game` now inherits all instance methods from `Book` class.
- And has an additional platform accessor.
- But... inherits isbn which games do not really have.

Inheritance

Example (Inheriting classes)

```
class Game < Book
  attr_accessor :platform
end
```

- `Game` now inherits all instance methods from `Book` class.
- And has an additional platform accessor.
- But... inherits isbn which games do not really have.

Inheritance

Example (Inheriting classes)

```
class Game < Book
  attr_accessor :platform
end
```

- `Game` now inherits all instance methods from `Book` class.
- And has an additional platform accessor.
- But... inherits isbn which games do not really have.

Inheritance

Example (Inheriting classes)

```
class Game < Book
  attr_accessor :platform
end
```

- `Game` now inherits all instance methods from `Book` class.
- And has an additional platform accessor.
- But... inherits isbn which games do not really have.

How do we fix it?

What we really want is:

Encapsulate the 'has name' functionality that allows classes to have a name and author and then include it into `Book` and `Game` classes.

How do we fix it?

What we really want is:

Encapsulate the 'has name' functionality that allows classes to have a name and author and then include it into `Book` and `Game` classes.

Solution:

Modules

What's a module

Definition (Module)

A Module is a collection of methods and constants.

Game plan:

- Create `HasName` module that gives `name` functionality.
- Weave it into `Book` and `Game` classes.

What's a module

Definition (Module)

A Module is a collection of methods and constants.

Game plan:

- Create `HasName` module that gives `name` functionality.
- Weave it into `Book` and `Game` classes.

What's a module

Definition (Module)

A Module is a collection of methods and constants.

Game plan:

- Create `HasName` module that gives `name` functionality.
- Weave it into `Book` and `Game` classes.

Declaring a module

```
module HasName
  attr_accessor :name, :author
end
```

- Same rules as for classes: must be capitalized.

Declaring a module

```
module HasName
  attr_accessor :name, :author
end
```

- Same rules as for classes: must be capitalized.

Using a module

```
class Book
  include HasName
  attr_accessor :isbn
end
class Game
  include HasName
  attr_accessor :platform
end
```

- Book and Game are now independent and shared functionality is abstracted neatly in the HasName module.

Principle #1 (DRY)

"Don't Repeat Yourself" principle:

If you have to do something more than once, abstract it away.

Principle #1 (DRY)

"Don't Repeat Yourself" principle:

If you have to do something more than once, abstract it away.

Why?

Principle #1 (DRY)

"Don't Repeat Yourself" principle:

If you have to do something more than once, abstract it away.

Why?

- Code duplication means you wrote it at least twice.

Principle #1 (DRY)

"Don't Repeat Yourself" principle:

If you have to do something more than once, abstract it away.

Why?

- Code duplication means you wrote it at least twice.
- Code duplication reduces clarity.

Principle #1 (DRY)

"Don't Repeat Yourself" principle:

If you have to do something more than once, abstract it away.

Why?

- Code duplication means you wrote it at least twice.
- Code duplication reduces clarity.
- Code duplication is much harder to keep in sync.

Principle #2 (YAGNI)

"You Ain't Gonna Need It" principle:

Always implement things when you actually need them, never when you just foresee that you need them.

But what about DRY?

- DRY things up when you actually repeat yourself, not when you think you may repeat yourself.

Principle #2 (YAGNI)

"You Ain't Gonna Need It" principle:

Always implement things when you actually need them, never when you just foresee that you need them.

Why?

But what about DRY?

- DRY things up when you actually repeat yourself, not when you think you may repeat yourself.

Principle #2 (YAGNI)

"You Ain't Gonna Need It" principle:

Always implement things when you actually need them, never when you just foresee that you need them.

Why?

- Time is better spent on something you actually need

But what about DRY?

- DRY things up when you actually repeat yourself, not when you think you may repeat yourself.

Principle #2 (YAGNI)

"You Ain't Gonna Need It" principle:

Always implement things when you actually need them, never when you just foresee that you need them.

Why?

- Time is better spent on something you actually need
- What you predict will happen usually is not what really happens.

But what about DRY?

- DRY things up when you actually repeat yourself, not when you think you may repeat yourself.

Principle #2 (YAGNI)

"You Ain't Gonna Need It" principle:

Always implement things when you actually need them, never when you just foresee that you need them.

Why?

- Time is better spent on something you actually need
- What you predict will happen usually is not what really happens.
- By the time you will need it, you will know the problem better.

But what about DRY?

- DRY things up when you actually repeat yourself, not when you think you may repeat yourself.

Principle #3 (Duck typing)

Duck typing principle:

If it walks like a duck and quacks like a duck, it is a duck.

Principle #3 (Duck typing)

Duck typing principle:

If it walks like a duck and quacks like a duck, it is a duck.

In practice that means

- What's important is what an object does, not what it is.

Principle #3 (Duck typing)

Duck typing principle:

If it walks like a duck and quacks like a duck, it is a duck.

In practice that means

- What's important is what an object does, not what it is.
- In duck-typed languages, interfaces are implicitly specified by defined methods.

Principle #3 (Duck typing, cont.)

```
class Library
  attr_accessor :books
  def catalog
    books.map { |b| b.name }.join ", "
  end
end
```

Principle #3 (Duck typing, cont.)

```
class Library
  attr_accessor :books
  def catalog
    books.map { |b| b.name }.join ", "
  end
end
```

Only things `Library` cares about:

- `books` responds to `map`.
- Each element of `books` responds to `name`.
- Whatever `b.name` returns must be concatenatable by `join`.

Principle #3 (Duck typing, cont.)

```
class Library
  attr_accessor :books
  def catalog
    books.map { |b| b.name }.join ", "
  end
end
```

Only things `Library` cares about:

- `books` responds to `map`.
- Each element of `books` responds to `name`.
- Whatever `b.name` returns must be concatenatable by `join`.

Principle #3 (Duck typing, cont.)

```
class Library
  attr_accessor :books
  def catalog
    books.map { |b| b.name }.join ", "
  end
end
```

Only things `Library` cares about:

- `books` responds to `map`.
- Each element of `books` responds to `name`.
- Whatever `b.name` returns must be concatenatable by `join`.

Adding Fixnum#inject

Suppose we want to be able to do:

```
sorted_profiles = 50.inject([]) do |acc|
  acc + [Profile.random!]
end.sort_by { |p| p.name }
```

But...

- But ruby doesn't have Fixnum#inject

Adding Fixnum#inject

Suppose we want to be able to do:

```
sorted_profiles = 50.inject([]) do |acc|
  acc + [Profile.random!]
end.sort_by { |p| p.name }
```

But...

- But ruby doesn't have Fixnum#inject

Adding Fixnum#inject (cont.)

No problem:

```
class Fixnum
  def inject(init = nil, &block)
    raise "Block missing" unless block_given?
    acc = init
    for i in 0..(self-1) do
      init = yield(init, i)
    end
  end
end
```

DRYing things up

```
module JavascriptHelper
  def author_js author
    "var author = "+
    "constructAuthor({ name: #{author.name}})"
  end
  def book_js book
    "var book = constructBook({ name: #{book.name}})"
  end
  def author_js_tag author
    script_tag author_js(author)
  end
  def book_js_tag book; script_tag book_js(book) end
end
```

DRYing things up (cont.)

Before:

```
def author_js_tag author
  script_tag author_js(author)
end
def book_js_tag book; script_tag book_js(book) end
```

- Both methods have a very similar structure.
- Both methods do the same things with their arguments.

DRYing things up (cont.)

Before:

```
def author_js_tag author
  script_tag author_js(author)
end
def book_js_tag book; script_tag book_js(book) end
```

- Both methods have a very similar structure.
- Both methods do the same things with their arguments.

DRYing things up (cont.)

Before:

```
def author_js_tag author
  script_tag author_js(author)
end
def book_js_tag book; script_tag book_js(book) end
```

- Both methods have a very similar structure.
- Both methods do the same things with their arguments.

DRYing things up (cont.)

After refactoring:

```
%w(book_js author_js).each do |js_method|
  define_method "#{js_method}_tag" do |item|
    script_tag send(js_method, item)
  end
end
```

- What about making all methods that end in _js to have a _tag counterpart?

DRYing things up (cont.)

After refactoring:

```
%w(book_js author_js).each do |js_method|
  define_method "#{js_method}_tag" do |item|
    script_tag send(js_method, item)
  end
end
```

- What about making all methods that end in `_js` to have a `_tag` counterpart?

DRYing things up (cont.)

After second refactoring:

```
instance_methods.select do |m|
  m =~ /_js$/
end.each do |js_method|
  define_method "#{js_method}_tag" do |*args|
    script_tag send(js_method, *args)
  end
end
```

Interfaces

Wikipedia says:

Interface generally refers to an abstraction that an entity provides of itself to the outside.

- In java, interface type defines how components may interact.
- In ruby, how components interact defines what interface they have.

  (That's called duck typing)

Interfaces
